Natural antioxidants – now also in soluble form

Nor-Group companies' natural antioxidants can be found in a variety of forms. Most of them are in powder form, so they can be mixed in feed in different concentrations; they can be included in pelleted, wet and meal feeds.

However, some of these products are now also available in a *soluble form*, including

- **Nor-Guard OV11 J**
- **Nor-Guard OV11 J Plus**

Both of these products are suitable for administration to animals via drinking water systems, most conveniently via a stock solution that is provided to the water string, for instance 1½ % from a medicator, e.g. Dosatron or Dosmatic.

The difference between the two products is that the **J-product** does not directly affect the animals' water intake – but focuses on reducing the animals' stress level and improving their immune system – while the **J Plus product** has the same effects, but it *also* increases the water intake. The positive impacts are relevant to newly weaned piglets, which will tend to drink too little water in the first days after weaning and therefore are being vulnerable to *E. coli* attacks.

Both products will reduce the newly weaned piglets' need for large amounts of ZnO , or for inclusion of Antibiotics, in the feed.
