

Increase the water intake at weaning

Nor-Group companies' natural soluble antioxidants can advantageously be used during periods, where the pigs own immune system is challenged.

Du-Drink is used primarily for newly weaned piglets. At weaning fluid intake dramatically decreases, resulting in weakened piglets with a higher risk of diarrhoea. **Du-Drink** has a sweet taste, which increases the water intake of the piglets. A larger water intake leads to a larger feed intake, which is beneficial for the weaned piglet, as they have a very high growth potential. Furthermore, **Du-Drink** consists of natural antioxidants that support the piglets in a period with a lot of stressors such as feed-change, vaccination and mixing.

Du-Drink is provided in the drinking water and can therefore be used for very specific periods. It is easy to use and is normally added as 150g in a 10 litres stock solution, which is provided through a Dosatron, Dosmatic or similar at 1 %.
